The Temporomandibular Joint: A Biological Basis For ...

The temporomandibular joint is a diarthrosis joint that connects the mandible to the temporal bone on the side of the skull (Griffin et al., 1975; Piette, 1993). The zygomatic process of the temporal bone has a concavity

called the articular fossa, which receives the convex condyle of the mandible.

The two temporomandibular joints (TMJs) form the bilateral articulation of the mandible with the cranium. Together with the neuromuscular system, the anatomy of the TMJ contributes to specific...

The Temporomandibular Joint | SpringerLink

The temporomandibular joints are the two joints connecting the jawbone to the skull. It is a bilateral synovial articulation between the temporal bone of the skull above and the mandible below; it is from these bones that its name is derived. This joint is unique in that it is a bilateral joint that functions as one unit. Since the TMJ is connected to the mandible, the right and left joints must function together and therefore are not independent of each other.

Temporomandibular joint - Wikipedia

Temporomandibular joint and muscle disorders are a group of conditions that cause pain and dysfunction in the jaw joint and the muscles that control jaw movement. The movement of the mandible needs coordination between them to maximize function and minimize the damage to surrounding structures.[1]

Etiological factors of temporomandibular joint disorders

Temporomandibular joint dysfunction (TMJ), also known as TMD, craniomandibular jaw disorder (CMJ) or craniomandibular disorder (CMD), refers to a group of conditions associated with pain and dysfunction of the masticatory system.

(TMD, TMJD) is an umbrella term covering pain and dysfunction of the muscles of mastication (the muscles that move the jaw) and the temporomandibular joints (the joints which connect the mandible to the skull).

Temporomandibular joint dysfunction - Wikipedia

Background: Temporomandibular joint disorders (TMDs) are chronic, often refractory, pain conditions affecting the jaw and face. Patients least likely to respond to allopathic treatment have the most marked biologic responsiveness to external stressors and concomitant psychosocial and emotional difficulties.

temporomandibular joint (TMJ), autogenous tissue grafting and alloplastic materials are regularly employed (1-3). Neither therapy is ideal, however, because allografts are associated with donor site morbidity and are poorly shaped for placement in TMJ defects, and alloplastics do not respond to normal biochemical or mechanical signals (4,5).

of the jaw and is frequently referred to
as TMJ. There are two TMJs, one on either
side, working in unison. The name is
derived from the two bones which form
the joint: the upper temporal bone which
is part of the cranium (), and the lower
jaw bone called the mandible. The unique
feature of the TMJs is the articular disc.
